

ESP 01 Introduction

L'ESP-01 est l'une des plus petites unités disponibles. Par rapport aux autres unités ESP, il est alimenté directement et doit donc être alimenté en 3,3 V et non en 5 V. Deux GPIO généraux sont disponibles et si vous avez besoin de plus, vous pouvez utiliser les deux ports série (1,3 / RX,TX).

Matériel

- Version de puce ESP : ESP8266
- Taille du flash : 1M
- Convertisseur USB-TTL intégré : Non
- GPIO éclaté/disponible pour une utilisation gratuite : 0, 2
- Informations sur l'alimentation : 3,3 VDC
- Antenne : antenne PCB intégrée

ESP-01 avec un microcontrôleur fonctionnant en 5V

Câblage/clignotement

Un programmeur est nécessaire pour flasher cet appareil.

- 'Programmeur' 'ESP'
- TX ↔ RX
- RX ↔ TX
- 'Pouvoir'
- 3.3V ↔ VDD
- Terre ↔ Terre

Afin d'obtenir l'unité en mode flash, le GPIO-0 doit être BAS et le CH-EN doit être réglé sur haut. Le CH-EN peut être connecté au VDD, sur les photos un cavalier est soudé entre ceux-ci mais vous pouvez 'utiliser une résistance pour vous assurer qu'aucune surintensité ne blesse l'unité'. Commencez à clignoter et effectuez une réinitialisation une fois afin de lancer le spectacle.

Les unités avec une puce mémoire étiquetée ' PUYA ' doivent être flashées avec les fichiers bin PUYA spécialement construits. Ceci est nécessaire car la puce PUYA doit être traitée d'une autre manière que les puces mem normales.

ESP-01 v3

Certains utilisateurs ont signalé que la réinitialisation ne fonctionnait pas sur les versions ultérieures de l'ESP-01. Il y a une résistance supplémentaire de 6k dans la ligne de réinitialisation (la nécessité de cette résistance est inconnue) entre EXT_RSTB et la broche RST du connecteur 8 broches. Après avoir retiré et remis un cavalier à sa place, la fonction RESET fonctionne à nouveau correctement. Donc, essentiellement, vous pontez simplement la résistance, ce qui en fait une ligne droite.
